Celonis - Field CTO

I spent 14 years building the integration middleware that SAP, Oracle, and enterprise platforms depended on to connect and operate. Now I help organizations design the agentic layer that runs on top of those systems. Celonis sits exactly at that intersection - and the Field CTO role is where I want to be.

At **iWay Software / Information Builders**, I served as Chief Software Architect and VP of Development for the enterprise integration portfolio. I architected the iWay Service Manager runtime, defined the adapter framework that became **U.S. Patent 7,421,709**, and led globally distributed engineering teams of up to 82 developers. That work required me to understand every enterprise system our adapters touched - and to translate that depth into architecture decisions that C-suite buyers could act on.

The posting calls for someone who can **"serve as a trusted advisor to C-level executives, aligning their long-term strategic goals"** with emerging agentic AI. I've done exactly that in successive roles. At **PAR Technology**, I served as Chief of Staff to the CTO, designed the 2025 Unified Commerce NorthStar architecture, and owned build/buy/integrate decisions across quarterly and annual horizons for a global restaurant-tech platform. At **Intelligent Audit**, I bridged CTO strategy and commercial delivery, stood up an enterprise observability practice in Datadog, and led AWS MAP planning for hybrid-cloud migration.

On the agentic AI side: I built **ADAM**, a local-first routine engine and operator console for data, automation, messaging, and multichannel delivery - and I designed the AI-native architecture for **BLT Core**, a payments-neutral hospitality platform built for rapid iteration and partner-led deployment. These aren't experiments. They're production systems with real architectural constraints, operator accountability, and commercial alignment built in.

I'm honest about the Celonis process-mining domain being new to me. What I bring is the enterprise integration foundation that process intelligence sits on, the pattern recognition to learn Celonis's model fast, and 35 years of translating complex technical systems into decisions that move businesses forward. The Field CTO role calls for that profile - and I'm ready to put it to work.

I'd welcome a conversation about where Celonis is taking process intelligence and agentic AI, and how my background fits the role.
